포팅 메뉴얼

1. Stacks

- Issue Management : **JIRA**

- SCM(Software Configuration Management) : **GITLAB**

- Communities : **Notion, MatterMost**

- Development Environment

  - **IntelliJ 2023.3**

  - **Android Studio Hedgehog | 2023.1.1**

  - **Java 17**

  - **Kotlin**

  - **Spring Boot 3.2.2**

  - **Ubuntu 20.04.6 LTS (AWS EC2)**

  - **MariaDB (azure)**

2. Env

- application.yml

```yaml
server:
  port: 포트 번호
spring:
  datasource:
    driver-class-name: com.mysql.cj.jdbc.Driver
    url: 싸피 DB
    username: 유저네임
    password: 비밀번호
  jpa:
    hibernate:
      ddl-auto: none

  data:
    redis:
      host: 레디스 호스트
      port: 포트 번호
```

```yaml
    security:
      oauth2:
        client:
          registration:
            google:
              client-id:  발급 받은 client ID
              client-secret: 발급 받은 Client Secret
              authorization-grant-type: 인증 코드
              redirect-uri: /oauth2/code/registrationId
              scope:
                - email
    servlet:
      multipart:
        max-file-size: 100MB
        max-request-size: 100MB

logging:
  level:
    root: info

cloud:
  aws:
    credentials:
      access-key: 액세스 키
      secret-key: 시크릿 키
    s3:
      bucket: 버킷 이름
    region:
      static: 지역 이름
      auto: false
    stack:
      auto: false
decorator:
  datasource:
```

```
        p6spy:
          enable-logging: true

    jwt:
      secret: jwt 시크릿키
```

3. Build & Distribute

- Git Clone

```
git clone https://lab.ssafy.com/s10-webmobile4-sub2/S10P12A3(
```

- Spring Boot

```
# Build
cd togeduck
chmod +x ./gradlew
./gradlew clean build
docker build -t togeduck:latest .
```

- Android

```
// Gradle Scripts - local.properties 에 아래 코드 추가 필요
naver_map_client_secret=네이버 api 인증키
```

- redis

```
docker pull redis:alpine
docker run -d -p 6379:6379 --name=redis redis:alpine
```

4. Deployment Command

Local

- Backend Server

```
docker run -d -p 8082:8082 --name togeduck togeduck:latest
```

- Android

```
build -> Generate Signed Bundle (apk로 추출)
```

EC2 - Jenkins Pipeline

- jenkins 프로젝트구성 - Pipeline - Pipeline Script 선택, 아래 스크립트 복사, 붙여넣기
  및 채우기

```
pipeline {
    agent any
    environment {
            repository = {리포지토리}
            DOCKERHUB_CREDENTIALS = credentials('dockerhub')
    }
    stages {
        stage('gitlab clone') {
            steps {
                // Get some code from a GitHub repository
                git branch: 'master', credentialsId: {credential
            }
        }

        stage('build') {
            steps {
                dir('togeduck') {
                    // some block
                    sh'''
                        echo build start
                        chmod +x ./gradlew
                        ./gradlew clean build
                    '''
```

```
            }
        }
    }
    stage('Cleaning up') {
        steps {
            sh "docker rmi $repository:latest" // docker ima
        }
    }
    stage('Building our image') {
        steps {
            script {
                dir('togeduck') {
                    // sh "docker build -t $repository:lates
                    dockerimage = docker.build("$repository
                }
            }
        }
    }
    stage('Login'){
        steps{
            sh 'echo $DOCKERHUB_CREDENTIALS_PSW | docker log
        }
    }
    stage('Deploy our image') {
        steps {
            script {
                docker.withRegistry('https://registry.hub.do
                    //  Building new image
                    dockerimage.push();
                }
            }
        }
    }
    stage('Pull image') {
        steps {
            sh "docker pull $repository:latest" // docker in
```

```
            }
        }
        stage('Run Image') {

            steps {
                dir('togeduck') {
                    sh'''
                        docker stop togeduck
                        docker rm togeduck
